Overview

Grease duct is ETL listed with a double-wall construction made from 430 stainless steel. Duct diameters range from 8" to 24", with multiple lengths and accessories available. Grease duct is ideal for use in kitchen ventilation applications and is available as a stand-alone system or part of a fully integrated package. Grease duct is pre-engineered for optimum performance for exhaust fans and hoods.

Double wall grease duct is ETL listed to Standard UL-1978 and UL-2221; Grease duct does not have to be welded in the field.

The purpose of the NFPA-96 Standard is to reduce the potential fire hazard of cooking operations, independent of the type of cooking equipment used and whether used in public or private facilities. Please refer to Chapter 7 of the NFPA-96 Standard, Exhaust Duct Systems, for detailed description of duct requirements and design.

All dimensions shown in American Standard (feet and inches).

Standards and Key Words

UL-1978 - Test Standard for Safety Grease Ducts.

UL- 2221 - Test Standard for Double Wall Grease Duct

NFPA-96 - Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations.

ETL - Edison Testing Laboratory, <http://www.intertek-etlsemko.com>. The ETL Listed Mark is the legal equivalent of the UL Listed and CSA Listed Marks throughout the United States and Canada. ETL is a Nationally Recognized Testing Laboratory (NRTL) designated by the Occupational Safety and Health Administration (OSHA).

Access Panel - A closure device used to cover an opening into a duct, an enclosure, equipment, or an appurtenance.

Authority Having Jurisdiction (AHJ) - An organization, office, or individual responsible for enforcing the requirements of a code or standard, or for approving equipment, materials, an installation, or a procedure.

Combustible Material - A material capable of undergoing combustion.

Factory-Built Grease Duct Enclosures - A listed factory-built grease duct system evaluated as an enclosure system for reduced clearances to combustibles and as an alternative to a duct with its fire-related enclosure.

Grease Duct - A containment system for the transportation of air and grease vapors that is designed and installed to reduce the possibility of the accumulation of combustible condensation and the occurrence of damage if a fire occurs within the system.

Grease Tight - Constructed and performing in such a manner as not to permit the passage of any grease under normal cooking conditions.

Fire Wall - A wall separating buildings or subdividing a building to prevent the spread of the fire, and having a fire resistance rating and structural stability.

Non-combustible Material - A material not capable of supporting combustion.

Thermal Expansion - The tendency of matter to increase in volume or pressure when heated.

References - NFPA-96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations, 2014 Edition.

Specifications

Furnish double-wall, factory built, grease duct for use with Type 1 kitchen hoods, which conforms to the requirements of NFPA-96. Products shall be ETL listed to UL-1978 and UL-2221 for venting air and grease vapors from commercial cooking operations as described in NFPA-96.

The duct's wall shall be constructed of 430 stainless steel and be available in diameters 8" through 24".

Grease duct shall have one of the manufacturer's listed insulation options and a finished outer stainless steel shell factory installed.

All welds on inner duct shall be dye tested at the factory to expose holes, if applicable. Holes are tested and resealed until duct is effectively sealed. All welds shall be painted for better aesthetics and corrosion prevention.

All supports, fan adapters, hood connections, fittings and expansion joints required to install grease duct shall be included.

Roof penetrations shall comply with listed clearance to combustibles (see Table 2 guide for details). The grease duct will terminate at the fan adapter plate, will be fully welded to the fan adapter plate, and the fan adapter plate will be fastened to the curb using a suitably sized fastener provided by the others (see "Operation, Installation, and Maintenance Manual [OIM]" for details).

Grease duct joints shall be held together by means of formed V bands and sealed with 3M Fire Barrier 2000+. Screws used to secure the vee bands shall be of the hex-head type with flanged stops and tapered "lead in" threads for easy starting. Nuts shall be retained by means of a free-floating cage to allow easy alignment.

Double-Wall Grease Duct shall be installed in accordance with the manufacturer's "Operation, Installation, and Maintenance Manual [OIM]", ETL listing, and state and local codes.

Grease duct installed outside of the building shall be protected against accidental damage or vandalism and should have the outer shell sealed to prevent the insulation from coming in contact with the elements.

Vertical duct shall be supported from the building structure using rigid structural supports. Anchor supports to the structure by welding or bolting steel expansion anchors or concrete inserts. Support horizontally installed grease duct from the building structure using above method or use Duct Mate, Wire Rope & Clutchers, part numbers WR20 & CL20. Saddles and 1/2" threaded rod may also be used for the support of horizontal grease duct.

The joint sealant used to seal all joint assemblies is a 3M product. 3M Fire Barrier 2000+ Silicone Sealant is a ready-to-use, gun-grade, one-component silicone elastomer that cures upon exposure to atmospheric humidity to form a flexible seal. When installed properly, the sealant will control the spread of fire before, during and after exposure to flames. No sealant substitutes may be used. Refer to **Table 1** for information on 3M Fire Barrier coverage.

TABLE 1 - 3M FIRE BARRIER 2000 PLUS USAGE

Duct Diameter	Duct Perimeter	Average Feet Per Tube	Number of Joints Per Tube
8"	2.16'	30	7
10"	2.68'	30	6
12"	3.21'	30	5
14"	3.73'	30	4
16"	4.25'	30	3.5
18"	4.78'	30	3
20"	5.30'	30	3
22"	5.83'	30	2.5
24"	6.35'	30	2.5

Clearances

Double-wall grease duct is primarily intended for use in applications where clearance to combustible materials is critical or where fire wrapping, single-wall duct is not feasible. Three insulation options exist for double-wall duct; each option is listed in **Table 2** with its respective clearances. Insulation and outer shell are factory installed, improving consistency and quality of the ductwork. This duct requires no further insulation after installation and, as a result, usually requires only one onsite inspection.

TABLE 2 - INSULATION AND CLEARANCES

Duct Diameter	Inner Diameter	Outer Diameter	Clearance to Combustibles	Clearance from tip of V band to Combustibles	Clearance to Non-Combustibles
DW-2R	8"-16"	ID + 4	3/4"	0"	0"
DW-3R	8"-24"	ID + 6	3/4"	0"	0"
DW-3Z	8"-24"	ID + 6	0"	0"	0"

Duct Design

Types of Pressure Losses or Resistance to Flow

Total pressure loss is a combination of static and dynamic pressure loss in a duct fitting. It is important to calculate total pressure loss as opposed to only static pressure loss, as dynamic pressure losses are a significant portion of total pressure loss.

Pressure loss in duct work has three components: component pressure losses (in duct-mounted equipment), dynamic pressure losses (in fittings) and frictional pressure losses (along duct walls):

Component Pressure Losses - Due to physical items with known pressure drops, such as hoods, filters, louvers, or dampers.

Dynamic Pressure Losses - Dynamic losses are the result of changes in direction and velocity of air flow. Dynamic losses occur whenever an air stream makes turns, diverges, converges, narrows, widens, enters, exits, or passes dampers, gates, orifices, coils, filters, or sound attenuators. Velocity profiles are reorganized at these places by the development of vortices that cause the transformation of mechanical energy into heat. The disturbance of the velocity profile starts at some distance and is usually assumed to be no shorter than six duct diameters for a straight duct. Dynamic losses are proportional to dynamic pressure and can be calculated using the equation:

$$\text{Dynamic Loss Static Pressure} = (\text{Loss Coefficient}) * (\text{Velocity Pressure})$$

Where the local loss coefficient, known as a C-coefficient, represents flow disturbances for particular fittings or for duct-mounted equipment as a function of their type and ratio of dimensions. Coefficients can be found in this document or the ASHRAE Fittings Diagrams Database.

A local loss coefficient can be related to different velocities; it is important to know which part of the velocity profile is relevant. The relevant part of the velocity profile is usually the highest velocity in a narrow part of a fitting cross section or a straight/branch section in a junction.

Frictional Pressure Losses

Frictional losses in duct sections are a/the result from air viscosity and momentum exchange among particles moving with different velocities. These losses also contribute negligible losses or gains in air systems unless there are extremely long duct runs or there are significant sections using flex duct.

$$\text{Friction Loss Static Pressure} = (0.195 * (\text{Center Line Distance} / \text{Diameter}) * (\text{Velocity Pressure}))$$

Total Static Pressure

$$\text{Total Static Pressure} = \text{Friction Loss Static Pressure} + \text{Dynamic Loss Static Pressure}$$

TABLE 3 - REQUIRED AIR AND DUCT VALUES & FORMULAS

Required Air and Duct Values	Formulas
Q = Air Flow Rate, Units = CFM	
D = Duct Diameter, Units = Feet	
A = Duct Cross Sectional Area, Units = Feet Squared	$A = \text{Pi} * (\text{D}/2)^2$
V = Air Velocity, Units = Feet/Minute	$V = \text{Q}/\text{A}$
VP = Velocity Pressure	$\text{VP} = (\text{V}/4005)^2$
L = Center Line Distance, Units = Feet	
C = Dynamic Loss Coefficient	Found in Tables Below
SPF = Frictional Loss Static Pressure	$\text{SPF} = 0.195 * (\text{L}/\text{D}) * \text{VP}$
SPD = Dynamic Loss Static Pressure	$\text{SPD} = \text{C} * \text{VP}$
SPC = Component Loss Static Pressure	
SP = Static Pressure	$\text{SP} = \text{SPF} + \text{SPD} + \text{SPC}$

Nomenclature

Grease duct parts are identified by a part type and part name (below).

TABLE 4 - NOMENCLATURE

Required Air and Duct Values	Formulas
LT = Straight Duct	AD = Access Door
AJD = Adjustable Duct	TEASY = Tee Assembly
AC = Adjustable Clamp for Adjustable Duct	ADIB = Access Door Inside Blank
CLASY = V Clamp Assembly	TEAD = Tee Assembly Access Door
Riser = Riser	ASY = Assembly in 30, 45, and 90
FRISER = Field Riser	ADP = Adapter
RERI = Retaining Ring for Field Riser	VESU = Vertical Support
TP = Transition Plate	SUBR = Horizontal Support Bracket
C2D = Offset Collar

Design Considerations

When using adjustable duct sections, within the duct horizontally or vertically, the minimum overlap required between the adjustable duct and the standard duct depends on the duct diameter (**Table 6**). In some scenarios, adjustable duct pieces will need to be cut in the field.

TABLE 6 - MINIMUM OVERLAP	
Diameter	Min Overlap for Adjustable Duct
8"	4"
10"	5"
12"	6"
14"	6"
16"	6"
18"	6"
20"	6"
22"	6"
24"	6"

Alignment and Bracing of Grease Duct

Grease duct has the characteristics of a continuous stainless steel pipe and it will expand and contract along its entire length with changes in its temperature. For this reason, conventional methods of attaching guides and braces to the outer wall of the grease duct cannot be used. Correctly installed support rings, saddles, and wall guide assemblies will serve to keep the duct aligned, provide for adequate resistance to lateral loads, and allow the free axial expansion and contraction movement. A simplified rule for duct expansion is that the axial growth will be approximately 1 inch per 100 feet of pipe length for each 100 degrees Fahrenheit the exhaust vapor temperature is above the surrounding air temperature. For support spacing information, refer to the pages on the different support methods later in this document.

Duct Diameter Sizing

The velocity of the air moving through the grease rated duct work must comply with NFPA-96, IMC, and local standards. The RuppAir Duct Diameter Sizing Charts will help when designing duct runs. These are located in **Appendix A** of this guide and on our website under Resources > Duct Sizing Information.

Duct Diameter Sizing Charts

The following is needed to determine the duct velocity: CFM and Area (Velocity = CFM/Area). In the chart below, the green selections indicate ideal design velocities, the yellow selections indicate fair design velocities and the red selections indicate bad design velocities. Velocities should never be designed in the red areas of the chart. Duct should be sized so that the velocity is between 500 and 2500 fpm. NFPA 96 requires a minimum duct velocity of 500 fpm. Always take the size of the fan curve into consideration when sizing duct. Under-sizing or over-sizing duct will cause system effect and or interfere with the fan curb."
